

Hello, today I want to show you how to modify a previously created 3D Vista project.

In this case it is a client that is a shopping center and several updates are made.

per year due to changes in establishments that open new ones, that close, that change location, modifications.

What needs to be done in TurboVirtual Here I have the first thing to have the list of.

updates, especially when taking photos. It is a list that I.

take it printed and I'm checking what I'm doing so that I don't forget anything. Then I rescue it.

here when editing the tour, to have it as a reference and follow an order. So.

We are going to explain this, this is the one that I had started here, but we are going to go in this.

from here for example I have already imported the new photos and tagged them, okay, here.

For example, it is the 24-1 update, which is the current one and it is a restaurant on the 3rd floor,.

this one in particular. So if I go to look for USA here, I have it here, this would be the new photo,.

okay, because I have labeled the one that is on floor 1 is from the update, from the first.

2024 update and it is in the stores category, they are the labels that I have used and.

In fact, I write them down here, I write them down here, update 24-1 in P1, I copy it and if I paste it here, I have all the new photos filtered here, in this case of the first floor, because I have tagged them all. the new ones with this update, all these updates.

They carry the label update 24-1 So if I come this way, let's go search,.

We can search in the list or add USA here, okay, the first problem we encounter is that.

This one is unrelated, we just imported it and I have no connection with this business here and with this business here This update is also due not only to the locals who have.

opened or closed or has changed location, but also by having changed in the way.

to photograph, now we have decided to photograph façade by façade and before we shared, we took a photo for example here to take a view here and another one there to reuse the panoramic view and now due to the technology of the 3D Vista miniature list, it is necessary for is listed in the thumbnails, if we go for example to the virtual tour preview,.

and we go to the ground floor, shops and we look, well Taylor, Taylor was alone, but when we jump forward, I am, she has taken the photo in the middle of the column and I was taking advantage of it for one business and another, but it won't let me , 3D Vista won't let me list, this is a panoramic and list this panoramic and why have the system like this as an independent business with its logo,.

We needed to take an individual photo of each business to be in front of each facade, so this update we have taken a photo here in front of the lotteries, a photo here in front of USA Fitness and in front of Taylor and also in the case of Taylor the logo has changed, We can't see here, this illuminated logo has been uploaded,

so we are going to explain how we proceed to modify an existing tour, because we already know when we create a tour from scratch, but.

In this case we are going to explain how to modify with this type of virtual tour, so the first thing I am going to do is, I am going to take the file name of this photo, which would be.

DSC4916 and I'll write it down here, DSC494916, okay, this would be USA9, I'll write it down here, I'll add a zero here, now I'm going to go to the one that was already published about lotteries, I have here.

Also, the new lottery and the old lottery, I'm going to the old one, which is the one published.,

this would be, this is the one we have to eliminate, very important, now I don't know about the hotspots, but no.

It's just that I don't have it, but I have to activate the hotspot tab and I sign up here.,

Which photo are we going to, we are going to keep this photo here, okay, that photo there would be this one here, we are keeping this one and this is where we are going to connect with the new lottery photo, because we have the one that is shared , then I am interested in writing down the number of the.

photo to which we go and we go to DSC09174 and this one for example, to maintain order I am going to.

put here, this would be the first photo from the beginning of the fasillo, the next photo would be the lotteries, which would be this, the new lotteries photo with its facade, this would be DSC094.,

We are going to put a new lottery in this one, we already have a new USA here and now we are going to go to Taylor, Taylor we also have both, the old one with the old façade and the new one, in this case we did have it individually but they have changed the decoration, then we have to change the connections.,

then we would have already noted the first one from the remaining part and that is the one that.

Let's go to the one we are going to start from to unite, we have to unite it with the new lottery.,

with the new lottery, with the new USA, the new USA, with the new Taylor it would be DSC0934, this would be the new Taylor and we are going to go to Dream, in this case the ones that already have the name.

we could by name but since we have two and it already exists, when we update one that does not.

exists we are not going to have that much of a problem but with the name of the file we will never fail, DSC0946 and this would be a new Dream, so I think we already have the update.,

here we are going to rescue the previous photo because we have this device here with a ladder on the outside.

of service and I was not interested in taking the new photo and here, for example, we are going to put Dream and we are going to the old hotspot control click, double click, here we have and of course here we have the view of this closed business and the old logo, so here we will have to retouch the photograph.,

It is a very peculiar case but I couldn't repeat this photo, I repeated this one here and I repeated this one here, so in this case we have to retouch but it is not the case now, so we already have it.,

let's start our sequence, we come here, copy, paste, we start and what we do is.

This lottery is the old one, we delete the hotspot, we come here and where we go to the new lottery, we copy,

now since I have changed the names of the files, this is what I was telling you.,

Now you would have to put the word file, file, a colon and paste the name of the file.,

here it calls us the name of the file and if not we could put lotteries since it is there but.

We would have the confusion of knowing if it is the new one or the old one, so we put the shortcut file, a colon and the name of the file that we had written down here, new lotteries.,

We check that we are in a hotspot, we take the photo and trace it and launch it, here I have the latest.

icons, the last hotspot used and for navigation I am using this one here, it now tells me to return, I continue with this straight line and place it here, as you have seen I have the click and go mode enabled, so I don't care about the size of the icons, then I click control and preview because if you look here it tells you that with control and.

preview I go to the preview from this same panoramic view, so now if I click forward I am already in the new view which is the lotteries and here it does not let us advance because.

we have to delete the old lottery, in fact we are going to delete it, we are going to take advantage of this.

point to delete the old photos, it would be loterías Antigua, USC Antigua and Tailor Antigua and Dream this new one that we have added, then we come to the list which is where it lets us delete and we tell it.

lotteries, with an accent mark surely, there it is, lotteries, this is the new one, we have already deleted the other one, usc is the new one and tailor this is the old one, this is the new one, you see the label system that.

How the workflow and dream benefit me are exactly the same, dream and the old work we place here we come here and usc new, control copy, filet, we drag the same, here is the line from here, over here and the return over here and here, preview control, we go to the preview and we go towards usc with a reference point and here it would be quite aligned and we go forward, back in this case, we return here and now we would have to go to tailor, now as we have deleted , tailor we already know what the new one is, we take it and drag it along.

here, return, facade over here, we add preview control, from the preview I am going to confirm that surely some hotspot has been left off hook and when you have the click and go mode.

enabled, the disconnected hotspots are shown with the original icon, if I come back here the other way because this is a circular route, this icon took me to the old dream.,

in fact it has no action, we are going to see it now because it does not exist, we have deleted it.,

We have deleted the old dream, so I take advantage of it and delete this one and if I put dream here we already have the new one and I add the new dream and I go back to Previous Mista, the click and go now detects us and we can now navigate.

Now yes, and now here too.

So let's go back to where we left off or we can do the reverse..

But to follow an order we are going to go to Loterías that we had stayed.,

and go to the USA, go to Taylor, we already have Taylor and now we have to unite it with Dream which is

exactly where we were.

New Dream, aligned here, there and around the corner we glue it here as far as possible aligned with Taylor's facade.

We confirm that we have the complete route.

Now I'm navigating with the navigation arrows and we haven't missed anything.,

but since we have done everything in order, we have Lotteries, we have USA, we have Taylor and we have Dream.

I hope this trick helps you when you have to update a virtual tour in 3D Vista.

Here there was a hallway in which there were three businesses that had to be separated because of the new photos.

So I leave you and continue from the list, I put my filter Act, update 24-1.,

and I have to connect all the new photos in the same way Regards.
