Today I want to show you the new trick that.

I have discovered to be able to have on the home screen of 3 view the custom os skin that.

Let's create or what.

Let's go shopping and have them ordered directly from importing for this we have to.

Go to our hard drive to the Vista 3 installation folder in program files if you have the beta you will have the other folder it would be the same action for both but we are going to.

do with the official version and inside the 3rd view folder we have the skins folder in the skins folder we have all the vts files that.

They would be the different predefined templates of 3 views and in this file in default data I have created my backup copies here the first thing that.

I recommend that you.

you see a backup copy of the file that.

create 3 views and we will open this file with a programming code editor in our case we use notepad++ which.

It is free open source software and it is free from the download tab you can download the different versions we open the default data file.

and here we have the code that can be opened in the windows notes blog but these software detect the different keys it is very important because.

It can give us an error in programming, it is very important that.

Each key has its partner for closing, so this program tells us the pairs of keys and brackets to close. If we go to the end of the document we see that.

has the class cars of red vehicles then we have to.

see that.

these keys are the style of vehicles and red and closes brackets in styles but opens it here so we have to.

add a new family a new family in this case I see you and coffees and an intro and copy from key to key to follow the same methodology there we would have duplicated the last family of vehicles then.

To replace it with I see you we just have to.

Go over writing the data after red vehicles we have put the comma and we have opened our keys and we have added I see you and virtual coffees for it followed by the first key we choose the name of.

the family the name of the style category we tell it now each skin we are going to open after types we are going to open as many keys with commas as skins we have within this category then.

We have to.

say I recommend opening a folder create different folders for the different categories so that.

do not mix with the predefined three views so in this case it is important that.

let's put the same name here and in the art skin document this is the file inside the folder I see you and this is the name that.

will show therefore here we have already added the first template the second oteleskin 10vts oteleskin the next one more tereskin the next real skin and the next travel skin we close block.

and we close and here I have added virtual cafes, I have added mine and here I will lose this from the original document so that.

I stayed.
